DETAILED ACTION

Drawings

1. Figure 1 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Allowable Subject Matter

2. Claims 2-4,6,10-13,15-20 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

3. The following is a statement of reasons for the indication of allowable subject matter: Prior art fails to show, the actuator as a comb structure acting on a lever arm, the actuator structured as a ratchet wheel, ratchet wedge and ratchet shaft. Prior art also fails to show, a compressive strain applied to the resonator as the temperature increases wherein; the first and second lever arm rotates about a pivot point so as to proportionally modify the amount of strain applied to the resonator beam and a actuator structured as a expansion bar that provides a actuation force proportional to a temperature.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1,5,7-9, and 14 is rejected under 35 U.S.C. 102(b) as being anticipated by Hsu (Mechanically Temperature-Compensated Flexural-Mode Micro- mechanical Resonator IEEE Dec 12, 2000).

Hsu discloses a micro mechanical resonator in fig.1-7 comprising: a resonator beam (A) suspended above a substrate(C) having a first end (E) and a second end (F) connected to the resonator beam. Wherein; the first end of the resonator beam is connected to the actuator (B); and a strain is applied onto the resonator beam by an actuation force. Wherein, the actuator is a large coefficient of the thermal expansion heater (H), which acts on the lever arm (D). Hsu also shows the actuator connected to the resonator beam through a lever arm fig. (1). Wherein, the lever (D) arm receives the actuation force from the actuator and transmits the actuation force by the actuator proportional to the resonator beam (see pages 399-402).
